IMPORTANT

VERIFICATION OF WARRANTY REGISTRATION

DEALER WARRANTY INFORMATION & REGISTRATION VERIFICATION

It is imperative that the selling dealer registers this machine with McConnel Limited before delivery to the end user – failure to do so may affect the validity of the machine warranty.

To register machines go to the McConnel Limited web site at www.mcconnel.com, log onto ‘Dealer Inside’ and select the ‘Machine Registration button’ which can be found in the Service Section of the site. Confirm to the customer that the machine has been registered in the section below.

Should you experience any problems registering a machine in this manner please contact the McConnel Service Department on 01584 875848.

Registration Verification

| Dealer Name: | ……………………………………………………………………………………………………… |
| Dealer Address: | ……………………………………………………………………………………………………… |
| Customer Name: | ……………………………………………………………………………………………………… |
| Date of Warranty Registration: | …../……/…… | Dealer Signature: ……………………… |

NOTE TO CUSTOMER / OWNER

Please ensure that the above section above has been completed and signed by the selling dealer to verify that your machine has been registered with McConnel Limited.

IMPORTANT: During the initial ‘bedding in’ period of a new machine it is the customer’s responsibility to regularly inspect all nuts, bolts and hose connections for tightness and re-tighten if required. New hydraulic connections occasionally weep small amounts of oil as the seals and joints settle in – where this occurs it can be cured by re-tightening the connection – refer to torque settings chart below. The tasks stated above should be performed on an hourly basis during the first day of work and at least daily thereafter as part of the machines general maintenance procedure.

CAUTION: DO NOT OVER TORQUE HYDRAULIC FITTINGS AND HOSES

WARRANTY POLICY

WARRANTY REGISTRATION

All machines must be registered, by the selling dealer with McConnel Ltd, before delivery to the end user. On receipt of the goods it is the buyer’s responsibility to check that the Verification of Warranty Registration in the Operator’s Manual has been completed by the selling dealer.

1. LIMITED WARRANTIES

1.01. All mounted machines supplied by McConnel Ltd are warranted to be free from defects in material and workmanship from the date of sale to the original purchaser for a period of 12 months, unless a different period is specified.

   All Self Propelled Machines supplied by McConnel Ltd are warranted to be free from defects in material and workmanship from the date of sale to the original purchaser for a period of 12 months or 1500 hours. Engine warranty will be specific to the Manufacturer of that unit.

1.02. All spare parts supplied by McConnel Ltd and purchased by the end user are warranted to be free from defects in material and workmanship from the date of sale to the original purchaser for a period of 6 months. All parts warranty claims must be supported by a copy of the failed part invoice to the end user. We cannot consider claims for which sales invoices are not available.

1.03. The warranty offered by McConnel Ltd is limited to the making good by repair or replacement for the purchaser any part or parts found, upon examination at its factory, to be defective under normal use and service due to defects in material or workmanship. Returned parts must be complete and unexamined. Pack the component(s) carefully so that any transit damage is avoided. All parts on hydraulic items should be drained of oil and securely plugged to prevent seepage and foreign body ingress. Certain other components, electrical items for example, may require particular care when packing to avoid damage in transit.

1.04. This warranty does not extend to any product from which McConnel Ltd’s serial number plate has been removed or altered.

1.05. The warranty policy is valid for machines registered in line with the terms and conditions detailed and on the basis that the machines do not extend a period of 24 months or greater since their original purchase date, that is the original invoice date from McConnel Limited. Machines that are held in stock for more than 24 months cannot be registered for warranty.

1.06. This warranty does not apply to any part of the goods, which has been subjected to improper or abnormal use, negligence, alteration, modification, fitment of non-genuine parts, accident damage, or damage resulting from contact with overhead power lines, damage caused by foreign objects (e.g. stones, iron, material other than vegetation), failure due to lack of maintenance, use of incorrect oil or lubricants, contamination of the oil, or which has served its normal life. This warranty does not apply to any expendable items such as blades, belts, clutch linings, filter elements, flails, flap kits, skids, soil engaging parts, shields, guards, wear pads, pneumatic tyres or tracks.

1.07. Temporary repairs and consequential loss - i.e. oil, downtime and associated parts are specifically excluded from the warranty.

1.08. Warranty on hoses is limited to 12 months and does not include hoses which have suffered external damage. Only complete hoses may be returned under warranty, any which have been cut or repaired will be rejected.

1.09. Machines must be repaired immediately a problem arises. Continued use of the machine after a problem has occurred can result in further component failures, for which McConnel Ltd cannot be held liable, and may have safety implications.

1.10. If in exceptional circumstances a non McConnel Ltd part is used to effect a repair, warranty reimbursement will be at no more than McConnel Ltd’s standard dealer cost for the genuine part.
1.11. Except as provided herein, no employee, agent, dealer or other person is authorised to give any warranties of any nature on behalf of McConnel Ltd.

1.12. For machine warranty periods in excess of 12 months the following additional exclusions shall apply:

1.12.1. Hoses, exposed pipes and hydraulic tank breathers.

1.12.2. Filters.

1.12.3. Rubber mountings.

1.12.4. External electric wiring.

1.12.5. Bearings and seals

1.12.6. External Cables, Linkages

1.12.7. Loose/Corroded Connections, Light Units, LED’s

1.12.8. Comfort items such as Operator Seat, Ventilation, Audio Equipment

1.13. All service work, particularly filter changes, must be carried out in accordance with the manufacturer’s service schedule. Failure to comply will invalidate the warranty. In the event of a claim, proof of the service work being carried out may be required.

1.14. Repeat or additional repairs resulting from incorrect diagnosis or poor quality previous repair work are excluded from warranty.

NB Warranty cover will be invalid if any non-genuine parts have been fitted or used. Use of non-genuine parts may seriously affect the machine’s performance and safety. McConnel Ltd cannot be held responsible for any failures or safety implications that arise due to the use of non-genuine parts.

2. REMEDIES AND PROCEDURES

2.01. The warranty is not effective unless the Selling Dealer registers the machine, via the McConnel website and confirms the registration to the purchaser by completing the confirmation form in the operator’s manual.

2.02. Any fault must be reported to an authorised McConnel Ltd dealer as soon as it occurs. Continued use of a machine, after a fault has occurred, can result in further component failure for which McConnel Ltd cannot be held liable.

2.03. Repairs should be undertaken within two days of the failure. Claims submitted for repairs undertaken more than 2 weeks after a failure has occurred, or 2 days after the parts were supplied will be rejected, unless the delay has been authorised by McConnel Ltd. Please note that failure by the customer to release the machine for repair will not be accepted as a reason for delay in repair or submitting warranty claims.

2.04. All claims must be submitted, by an authorised McConnel Ltd Service Dealer, within 30 days of the date of repair.

2.05. Following examination of the claim and parts, McConnel Ltd will pay, at their discretion, for any valid claim the invoiced cost of any parts supplied by McConnel Ltd and appropriate labour and mileage allowances if applicable.

2.06. The submission of a claim is not a guarantee of payment.

2.07. Any decision reached by McConnel Ltd. is final.

3. LIMITATION OF LIABILITY

3.01. McConnel Ltd disclaims any express (except as set forth herein) and implied warranties with respect to the goods including, but not limited to, merchantability and fitness for a particular purpose.

3.02. McConnel Ltd makes no warranty as to the design, capability, capacity or suitability for use of the goods.

3.03. Except as provided herein, McConnel Ltd shall have no liability or responsibility to the purchaser or any other person or entity with respect to any liability, loss, or damage caused or alleged to be caused directly or indirectly by the goods including, but not limited to, any indirect, special, consequential, or incidental damages resulting from the use or operation of the goods or any breach of this warranty. Notwithstanding the above limitations and warranties, the manufacturer’s liability hereunder for damages incurred by the purchaser or others shall not exceed the price of the goods.

3.04. No action arising out of any claimed breach of this warranty or transactions under this warranty may be brought more than one (1) year after the cause of the action has occurred.
4. MISCELLANEOUS

4.01. McConnel Ltd may waive compliance with any of the terms of this limited warranty, but no waiver of any terms shall be deemed to be a waiver of any other term.

4.02. If any provision of this limited warranty shall violate any applicable law and is held to be unenforceable, then the invalidity of such provision shall not invalidate any other provisions herein.

4.03. Applicable law may provide rights and benefits to the purchaser in addition to those provided herein.

McConnel Limited
DECLARATION OF CONFORMITY
Conforming to EU Machinery Directive 2006/42/EC

We,

McCONNEL LIMITED, Temeside Works, Ludlow, Shropshire SY8 1JL, UK

Hereby declare that:

The Product; Tractor Mounted Hedgecutter / Grass Mower

Product Code; P470

Serial No. & Date ………………………………… Type …………………………….

Manufactured in; United Kingdom

Complies with the required provisions of the Machinery Directive 2006/42/EC
The machinery directive is supported by the following harmonized standards;

This system is continually assessed by the;
British Standards Institution (BSI), Beech House, Milton Keynes, MK14 6ES, UK
BSI is accredited by UK Accreditation Service, accreditation number: UKAS 003.
The EC declaration only applies if the machine stated above is used in accordance with the operating instructions.

Signed ……………………………… Responsible Person
CHRISTIAN DAVIES on behalf of McCONNEL LIMITED

Status: General Manager          Date: January 2018
A daily equipment inspection of the tractor and mower should be conducted before the equipment is used. You may use the inspection sheets to assist with these daily inspections. Any damaged or missing guards should be repaired or replaced before operating the mower. Failure to repair the damaged shield can result in objects being thrown from the mower and possibly hitting the operator or bystander.

Inspect the Mower for Safe Operating Condition

- Make sure the driveline guards and shielding are in place and in good repair.
- Inspect the flexible thrown object shielding to assure that they are in place on the front and rear of the mower head and in good repair. Repair or replace any damaged or missing thrown object shields.
- Ensure the mower cutting height is set high enough to reduce the possibility of the mower blades contacting the ground. Actual height will be dependent on the ground conditions. Increase the height when working in rough or undulating conditions.
- Inspect for broken, chipped, bent, missing, or severely worn blades. Replace damaged blades before operating the mower. Ensure the blade retaining bolts and fasteners are secure and tight.
- Ensure all head bolts and nuts are tight.
- Lubricate the driveline universal joints and telescoping members daily.
- Grease the rotor and roller bearings and inspect their condition.
- Inspect for any oil leaks or damaged hoses
- Inspect for worn or damaged decals and safety instructions. Replace unreadable, damaged or missing safety decals.
- Follow the operator’s manual(s) inspection and maintenance instructions for lubricating parts, and keeping thrown object shielding, driveline guards, rotating parts shields, mower blades and decals in good repair.

Inspect the Tractor for Safe Operating Condition:

- Inspect the controls, lights, SMVs (Slow Moving Vehicle sign), seat belts, and ROPS to assure that they are in place and in good working order.
- Be sure the tires, wheels, lug bolts/nuts are in good condition.
- Make sure the tractor brakes and steering are in proper operating condition.
- Follow the operator’s manual(s) inspection and maintenance procedures for keeping the tractor in good and safe condition before operating.

The inspection sheet on the following page should be kept in this book as a record. A second sheet is included for you to cut out and photocopy or the inspection sheets can be downloaded from our website at; http://www.mcconnel.com/support/aftersales/default.aspx?nav=After Sales
WARNING  Before conducting the inspection, make sure the tractor engine is off, the key removed, all rotation has stopped and the tractor is in park with the parking brake engaged. Make sure the mower head is resting on the ground or is securely blocked up and supported and all hydraulic pressure has been relieved.

**DO NOT OPERATE an UNSAFE TRACTOR or MOWER**
For Safety and Performance…

ALWAYS READ THE BOOK FIRST

- NOISE STATEMENT -
The equivalent daily personal noise exposure from this machine measured at the operators’ ear is within the range 78 – 85 dB, these figures apply to a normal distribution of use where the noise fluctuates between zero and maximum. The figures assume that the machine is fitted to a tractor with a ‘quiet’ cab with the windows closed in a generally open environment. We recommend that the windows are kept closed. With the cab rear window open the equivalent daily personal noise exposure will increase to a figure within the range 82 – 88 dB. At an equivalent daily noise exposure level of 85 – 90 dB ear protection is recommended and must always be used if any window is left open.

WARNING
Cancer and Reproductive Harm
www.P65Warnings.ca.gov
D960

Operating, servicing and maintaining this equipment can expose you to chemicals including gasoline, diesel fuel, lubricants, petroleum products, engine exhaust, carbon monoxide, and phthalates, which are known to the State of California to cause cancer and birth defects or other reproductive harm. To minimize exposure, avoid breathing exhaust, do not idle the engine except as necessary, service your vehicle in a well-ventilated area and wear gloves or wash your hands frequently when servicing your vehicle. Battery posts, terminals and related accessories contain lead and lead compounds, chemicals known to the state of California to cause cancer, birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov. This website, operated by California's Office of Environmental Health Hazard Assessment, provides information about these chemicals and how individuals may be exposed to them.

GENERAL INFORMATION

Read this manual before fitting or operating the machine. Whenever any doubt exists contact your dealer or the McConnel Service Department for assistance.

**Use only McConnel Genuine Parts on McConnel equipment and machines.**

**DEFINITIONS;** The following definitions apply throughout this manual:

**WARNING:**
An operating procedure, technique etc., which can result in personal injury or loss of life if not observed carefully.

**CAUTION:**
An operating procedure, technique etc., which can result in the damage of either machine or equipment if not observed carefully.

**NOTE:**
An operating procedure, technique etc., which is considered essential to emphasise.

**LEFT AND RIGHT HAND:**
This term is applicable to the machine when fitted to the tractor and viewed from the rear. This also applies to tractor references.

Note: The illustrations in this manual are for instructional purposes only and may on occasion not show some components in their entirety. In some instances an illustration may appear slightly different to that of your particular model but the general procedure will be the same. E&OE.

MACHINE & DEALER INFORMATION

Record the Serial Number of your machine on this page and always quote this number when ordering parts. Whenever information concerning the machine is requested remember also to state the make and model of tractor to which the machine is fitted.

- 4.7m (15’ 5”) Reach
- Fully Independent or Semi-independent Hydraulic System
- Cable or Electric Rotor Control
- Three-point Linkage Mounting System
- Parallel Arm Geometry
- Mechanical Safety Breakaway
- Left or Right Hand Build
- Operator Guard
- 45HP High Performance Hydraulic System
- 180 Litre Hydraulic Reservoir
- Choice of Operator Controls – Cable, Electric or Proportional
- Choice of Flailheads

PA5045 Models
- 5.0m (16’ 5”) Reach
- Fully Independent or Semi-independent Hydraulic System
- Cable or Electric Rotor Control
- Three-point Linkage Mounting System
- Parallel Arm Geometry
- Mechanical Safety Breakaway
- Left or Right Hand Build
- Operator Guard
- 45HP High Performance Hydraulic System
- 150 Litre Hydraulic Reservoir
- Choice of Operator Controls – Cable, Electric or Proportional
- Choice of Flailheads

Optional Extras
- Lift Float Kit – Manual or Electric
- Angle Float – Electric Models Only
- Debris Blower Mounting Kit
- Lighting Kit
- Cooler Kit
This machine has the potential to be extremely dangerous, in the wrong hands it can kill or maim. It is therefore imperative that both owner, and operator of this machine, read and understand the following section to ensure that they are fully aware of the dangers that do, or may exist, and their responsibilities surrounding the use and operation of the machine. The operator of this machine is responsible not only for their own safety but equally for the safety of others who may come into the close proximity of the machine, as the owner you are responsible for both.

When the machine is not in use the cutting head should be lowered to rest on the ground. In the event of a fault being detected with the machine’s operation it should be stopped immediately and not used again until the fault has been corrected by a qualified technician.

POTENTIAL SIGNIFICANT DANGERS ASSOCIATED WITH THE USE OF THIS MACHINE:

▲ Being hit by debris thrown by rotating components.
▲ Being hit by machine parts ejected through damage during use.
▲ Being caught on a rotating power take-off (PTO) shaft.
▲ Being caught in other moving parts i.e.: belts, pulleys and cutting heads.
▲ Electrocution from Overhead Power Lines (by contact with or ‘flashover’ from).
▲ Being hit by cutting heads or machine arms as they move.
▲ Becoming trapped between tractor and machine when hitching or unhitching.
▲ Tractor overbalancing when machine arm is extended.
▲ Injection of high-pressure oil from hydraulic hoses or couplings.
▲ Machine overbalancing when freestanding (out of use).
▲ Road traffic accidents due to collision or debris on the road.
BEFORE USING THIS MACHINE YOU MUST:

▲ Ensure you read all sections of the operator handbook.
▲ Ensure the operator is, or has been, properly trained to use the machine.
▲ Ensure the operator has been issued with and reads the operator handbook.
▲ Ensure the operator understands and follows the instructions in operator handbook.
▲ Ensure that all machine guards are in position, are undamaged, and are kept maintained in accordance with the manufacturer’s recommendations.
▲ Ensure flails and their fixings are of a type recommended by the manufacturer, are securely attached and that none are missing or damaged.
▲ Ensure hydraulic pipes are carefully and correctly routed to avoid damage by chaffing, stretching or pinching and that they are held in place with the correct fittings.
▲ Always follow the manufacturer’s instructions for attachment and removal of the machine from the tractor.
▲ Check that the machine fittings and couplings are in good condition.
▲ Ensure the tractor meets the minimum weight recommendations of the machine’s manufacturer and that ballast is used as necessary.
▲ Always inspect the work area thoroughly before starting to note obstacles and remove wire, bottles, cans and other debris.
▲ Use clear suitably sized warning signs to alert others to the nature of the machine working within that area. Signs should be placed at both ends of the work site. *(It is recommended that signs used are of a size and type specified by the Department of Transport and positioned in accordance with their, and the Local Highways Authority, guidelines).*
▲ Ensure the operator is protected from noise. Ear defenders should be worn and tractor cab doors and windows must be kept closed. Machine controls should be routed through proprietary openings in the cab to enable all windows to be shut fully.
▲ Always work at a safe speed taking account of the conditions i.e.: terrain, highway proximity and obstacles around and above the machine. Extra special attention should be applied to Overhead Power Lines. Some of our machines are capable of reach in excess of 8 metres (26 feet) this means they have the potential to well exceed, by possibly 3 metres (9’ 9’’), the lowest legal minimum height of 5.2 metres from the ground for 11,000 and 33,000 volt power lines. It cannot be stressed enough the dangers that surround this capability, it is therefore vital that the operator is fully aware of the maximum height and reach of the machine, and that they are fully conversant with all aspects regarding the safe minimum distances that apply when working with machines in close proximity to Power Lines. *(Further information on this subject can be obtained from the Health & Safety Executive or your Local Power Company).*
▲ Always disengage the machine, kill the tractor engine, remove and pocket the key before dismounting for any reason.
▲ Always clear up all debris left at the work area, it may cause hazard to others.
▲ Always ensure when you remove your machine from the tractor that it is left in a safe and stable position using the stands and props provided and secured if necessary.
WHEN NOT TO USE THIS MACHINE:

▲ Never attempt to use this machine if you have not been trained to do so.

▲ Never use a machine until you have read and understood the operator handbook, are familiar with it, and practiced the controls.

▲ Never use a machine that is poorly maintained.

▲ Never use a machine if guards are missing or damaged.

▲ Never use a machine on which the hydraulic system shows signs of wear or damage.

▲ Never fit, or use, a machine on a tractor that does not meet the manufacturer’s minimum specification level.

▲ Never use a machine fitted to a tractor that does not have suitable front, rear and side(s) cab guarding made of metal mesh or polycarbonate.

▲ Never use the machine if the tractor cab guarding is damaged, deteriorating or badly fitted.

▲ Never turn a machine cutting head to an angle that causes debris to be ejected towards the cab.

▲ Never start or continue to work a machine if people are nearby or approaching - Stop and wait until they are at a safe distance before continuing. WARNING: Some Cutting Heads may continue to ‘freewheel’ for up to 40 seconds after being stopped.

▲ Never attempt to use a machine on materials in excess of its capability.

▲ Never use a machine to perform a task it has not been designed to do.

▲ Never operate the tractor or machine controls from any position other than from the driving seat, especially whilst hitching or unhitching the machine.

▲ Never carry out maintenance of a machine or a tractor whilst the engine is running – the engine should be switched off, the key removed and pocketed.

▲ Never leave a machine unattended in a raised position – it should be lowered to the ground in a safe position on a level firm site.

▲ Never leave a tractor with the key in or the engine running.

▲ Never carry out maintenance on any part or component of a machine that is raised unless that part or component has been properly substantially braced or supported.

▲ Never attempt to detect a hydraulic leak with your hand – use a piece of cardboard.

▲ Never allow children near to, or play on, a tractor or machine under any circumstances.
PTO DRIVE SHAFT SAFETY PRECAUTIONS

ON EVERY TRACTOR:

▲ ALWAYS ensure the correct end of the driveshaft is fitted to the tractor. See labels on the drive shaft.

▲ ALWAYS check carefully that the drive shaft does not ‘bottom out’ and that a minimum of 6" (150mm) of engagement is maintained.

▲ ALWAYS ensure that the guards are always in position, can rotate freely and the check chains are not stretched when the machine is raised or lowered.

▲ ALWAYS check that when, in the continuous working position, the drive shaft is not at an angle of more than 20 degrees to the PTO centre line.

▲ ALWAYS ensure the drive shaft does not foul the tractor PTO guard, the gearbox-input shield or the tractor draw bar.
ADDITIONAL SAFETY ADVICE

Training
Operators need to be competent and fully capable of operating this machine in a safe and efficient way prior to attempting to use it in any public place. We advise therefore that the prospective operator make use of relevant training courses available such as those run by the Agricultural Training Board, Agricultural Colleges, Dealers and McConnel.

Working in Public Places
When working in public places such as roadsides, consideration should be paid to others in the vicinity. Stop the machine immediately when pedestrians, cyclists and horse riders etc. pass. Restart only when they are at a distance that causes no risk to their safety.

Warning Signs
It is advisable that any working area be covered by suitable warning signs and statutory in public places. Signs should be highly visible and well placed in order to give clear advanced warning of the hazard. Contact the Department of Transport or your Local Highways Authority to obtain detailed information on this subject. The latter should be contacted prior to working on the public highway advising them of the time and location of the intended work asking what is required by way of signs and procedure. – ‘Non-authorised placement of road signs may create offences under the Highways Act’.

Suggested Warning Signs Required
“Road works ahead” warning sign with a supplementary “Hedge cutting” plate. “For 1 mile” or appropriate shorter distance may be added to the plate.

“Road narrows” warning sign with supplementary “Single file traffic” plate.

White on blue “Keep right” (*) arrow sign on rear of machine.
* Note – this applies to UK Market machines where traffic passes to the right of a machine working in the same direction as the traffic flow. The direction, use and colour of the arrow sign will depend on the country of use and the Local Highway Authorities regulations in the locality.

Use of Warning Signs
▲ On two-way roads one set of signs is needed facing traffic in each direction.
▲ Work should be within 1 mile of the signs.
▲ Work only when visibility is good and at times of low risk e.g.: NOT during ‘rush-hour’.
▲ Vehicles should have an amber-flashing beacon.
▲ Ideally, vehicles should be conspicuously coloured.
▲ Debris should be removed from the road and path as soon as practicable, and at regular intervals, wearing high visibility clothing and before removing the hazard warning signs.
▲ Collect all road signs promptly when the job is completed.

Although the information given here covers a wide range of safety subjects, it is impossible to predict every eventuality that can occur under differing circumstances whilst operating this machine. No advice given here can replace ‘good common sense’ and ‘total awareness’ at all times, but it will go a long way towards the safe use of your McConnel machine.
TRACTOR REQUIREMENTS

**Tractor Weight**
Minimum tractor weight including ballast: 2500kg.

**HP Requirements**
Suitable for tractors of minimum 50HP.

**Tractor Linkage**
Three-Point Linkage Cat. 2

**PTO Shaft**
Tractor must be equipped with a live drive PTO to enable forward motion to be stopped while the flail head continues to operate.

**Linkage Isolation**
A linkage isolation facility is necessary for SI models only.

**Check Chains/Stabilizers:**
Check chains or stabilizers must be fitted and correctly tightened.

**Tractor Relief Valve**
For SI models only, tractor relief valve must be set above 2000 psi (140 Bar).

**Tractor Hydraulic Flow Rate**
Hydraulic flow rates are not crucial for SI models.

**Closed Centre Conversion Kit (SI Models only)**
A control valve conversion kit (*Part No. 8130059*) consists of a relief valve blanking plug which should be installed in place of the existing relief valve and a pressure gallery blanking adaptor which is installed in place of the standard adaptor at the valve outlet end next to the lift loop hose connection.

*NOTE: Care should be taken when extracting the relief valve so as not to damage the copper sealing washer as this is to be re-used.*
TRACTOR PREPARATION

Wheel Width
Set wheel widths as wide as possible.

Lift Links
Adjust lift links until they are equal length.

Tractor Ballast
It is imperative when attaching ‘third-party’ equipment to a tractor that the maximum possible stability of the machine and tractor combination is achieved – this can be accomplished by the utilization of ‘ballast’ in order to counter-balance the additional equipment added.

Front Weights
Front weights may be required to place 15% of total outfit weight on the front axle for stable transport on the road and to reduce ‘crabbing’ due to the drag of the cutting unit when working on the ground.

Rear Weights
Rear weights may be required to maintain a reasonable amount of rear axle load on the opposite wheel from the arms when in work; for normal off-ground work i.e. hedge cutting this should be 20% of rear axle weight or more for adequate control, and for ground work i.e. verge mowing with experienced operators, this can be reduced to 10%.

All factors must be addressed in order to match the type and nature of the equipment added to the circumstances under which it will be used – in the instance of Power Arm Hedgecutters it must be remembered that the machines centre of gravity during work will be constantly moving and will differ from that during transport mode, therefore balance becomes critical.

Factors that affect stability:
- Centre of gravity of the tractor/machine combination.
- Geometric conditions, e.g. position of the cutting head and ballast.
- Weight, track width and wheelbase of the tractor.
- Acceleration, braking, turning and the relative position of the cutting head during these operations.
- Ground conditions, e.g. slope, grip, load capability of the soil/surface.
- Rigidity of implement mounting.

Suggestions to increase stability:
- Increasing rear wheel track; a tractor with a wider wheel track is more stable.
- Ballasting the wheel; it is preferable to use external weights but liquid can be added to around 75% of the tyre volume – water with anti-freeze or the heavier Calcium Chloride alternative can be used.
- Addition of weights – care should be taken in selecting the location of the weights to ensure they are added to a position that offers the greatest advantage.
- Front axle locking; a ram can be used to ‘lock’ the front axle in work only – locking the axle moves the ‘balance line’ and can be used to transfer weight to the front axle from the rear (check with tractor manufacturer).

The advice above is offered as a guide for stability only and is not a guide to tractor strength - it is therefore recommended that you consult your tractor manufacturer or local dealer to obtain specific advice on this subject, additionally advice should be sought from a tyre specialist with regard to tyre pressures and ratings suitable for the type and nature of the machine you intend to fit.
PRE-ATTACHMENT

The machine will be delivered in a partially dismantled condition secured with transport strap and banding. Select a firm level site on which locate the machine for pre-attachment.

Raise the machine using suitable overhead lifting equipment with a minimum capacity of 1500kg SWL. **Leave in position at this stage.**

Lower the legs and pin in position.

Cut banding straps and remove transport strap, stabiliser and other loose items.

**Hydraulic Oil Reservoir**

Fill the tank with oil selected from the oil chart, *(see following page)*, or a good quality equivalent to a point where the level is between the minimum and maximum marks on the tank gauge. When the machine is initially run the level will drop as the oil is drawn into the circuit - top back up as required to the correct level on the gauge.

Always use clean receptacles when handling and transferring oil to avoid moisture or dirt contamination that can damage components and/or reduce machine performance.

**NOTE:** Refer to the maintenance section for further information on the subject of hydraulic oil and system filtration.

**Reservoir Capacity**

The oil tank capacity of the machine is approximately **180 Litres**.

Providing the machine is stable, the overhead lifting equipment may now be removed.
**Recommended Hydraulic Oils**
For initial filling of the oil reservoir, periodic oil changes and replenishment purposes the following hydraulic oils, or a good quality equivalent are recommended:

**NOTE:** Only use oils that are ISO 18/16/13, NAS7, or cleaner.

SI Models only
Connect up the supply and return hoses to the tractor.
Supply: From tractors auxiliary service.
Return: To tractors transmission casing (Refer to tractor manufacturers handbook).
Select tractors external services.
PTO DRIVESHAFT INSTALLATION

The PTO driveshaft attaches between the tractor and the machine gearbox to transfer the power required to the run and operate the machine – it is important to achieve the correct shaft length to avoid risk of it ‘bottoming out’ when raising or lowering the machine. The procedure for measuring and cutting the shaft is as follows:

Measuring the PTO Shaft

With the machine attached to the tractor in the working position measure the horizontal distance ‘A’ from the tractor’s PTO to the input shaft on the machines gearbox and subtract 75mm (3”) – this figure is the required shaft length.

Place the fully closed PTO shaft on the ground and measure its overall length, if the shaft is shorter than the required length you can use it without the need to shorten - providing it allows for a minimum 150mm (6”) overlap when fitted.

If the shaft is longer subtract the required shaft length plus an additional 75mm (3”) - the resulting figure is the excess length that will need to be removed from each half of the shaft.

Cutting the PTO Shaft

Separate the two halves and using the measurement obtained above shorten both the plastic guarding and the inner steel profile tubes of each shaft by this same amount. De-burr the cut tubes with a file to remove rough or sharp edges and thoroughly clean to remove swarf before greasing, assembling and fitting the shaft.

NOTE: For subsequent use with different tractors the shaft should be measured again to check suitability – there must be a minimum shaft overlap of 150mm (6”).

Maintenance

To increase the working life of the PTO shaft it should be periodically checked, cleaned and lubricated.

WARNING:
Always attach torque chains to PTO guards to stop them from rotating with the driveshaft.
FITTING OPERATOR CONTROL UNITS

Fitment of the operator controls in the tractor cab will vary depending on the particular model or specification of machine – the information below lists the differing methods of fitment for the various types of controls available.

Cable Controls
Cable control units are provided with, and attached to, a mounting bracket – the bracket should be securely fixed to the internal mud wing or cab cladding in a suitable convenient location that offers ease of use without interfering with normal tractor operation.
In deciding the final position of the control unit bear in mind the location of the cable run – make sure the minimum acceptable cable bend radii of 8" (200mm) is not exceeded.
Ensure during fitting that no structural member of the tractor cab or roll bar is drilled or damaged.
The cable rotor control valve lever on cable controlled machines will be assembled as a component part of the main bank of controls and therefore shares the same mounting bracket.
On electric machines with cable operated rotor control valve the lever will be supplied as a ‘standalone’ unit with its own individual mounting bracket – this should be fitted in the same manner as above adopting the same precautions pertaining to attachment and cable runs.

Electric Controls
Depending on the particular type of control, electric units are supplied either with a mounting bracket or a mounting pillar which should be bolted to the internal mud wing or cab cladding in a suitable convenient location that offers ease of use without interfering with normal tractor operation. Mounting pillars can be bent or twisted to achieve a comfortable working position.
Ensure during fitting that no structural member of the tractor cab or roll bar is drilled or damaged.
The power supply cable should be connected directly to the tractors battery - do not use cigarette lighter type connections as these prove to be sporadic and unreliable for control applications. Control units are 12 volt D.C. operated; the brown lead is positive (+) and the blue lead is negative (-).

Proportional Controls
Revolution Proportional Controls comprise of 2 units; the control screen and the armrest control unit. The control screen is supplied with a mounting bracket and suction cup assembly that allows the unit to be mounted onto the window of the tractor cab – ensure the surface used is clean and dry and that the unit is mounted in a position where it does not obstruct operator vision. The armrest control is designed to slide over the armrest of the tractor seat and is held in place with the fixing straps provided.
The power supply cable should be connected directly to the tractors battery - do not use cigarette lighter type connections as these prove to be sporadic and unreliable for control applications. Control units are 12 volt D.C. operated; the brown lead is positive (+) and the blue lead is negative (-).
FLAILHEAD ATTACHMENT

For ease of attachment and safety, this procedure is best performed on a firm level site. With the tractor parked alongside the flailhead operate the controls of the machine to position the pivot bracket of the machine’s head angling mechanism directly behind the flailhead with the base of the hose tray (or junction bracket) parallel to the ground. Maneuvre the flailhead backwards on its roller until the heads attachment bracket is adjacent to the machine’s pivot bracket. Fit the 4 attachment bolts through the brackets from the arm side - if the holes are mis-aligned carefully operate the angling ram until the holes correspond.

WARNING: Ensure all persons remain at a safe distance whilst operating the angling function as the geometry of the head angling mechanism produces several pinch risk areas.

With the attachment bolts correctly located through the brackets fit the self-locking nuts and tighten alternately until the brackets are drawn flush before finally tightening them to a torque setting of 203Nm (150ft.lbs).

Flailhead Hose Attachment

With the flailhead attached to the machine the hydraulic hoses can now be connected – refer to diagrams opposite. Upper port ‘A’ on the motor connects to junction bracket point ‘A’ on the arm and lower port ‘B’ on the motor connects to junction bracket point ‘B’ on the arm.

Note: If a hose tray is already fitted to the arm it will need to be removed to allow the hoses to be connected to the junction bracket – ensure the hose tray is replaced once the hoses have been connected.
RUNNING UP PROCEDURE

CAUTION! Before initial use of a new machine, all lubrication points must be greased and the gearbox and oil tank levels checked and where required topped up before attempting to use the machine. See maintenance section for details.

TI Models only
Ensure that the rotor control valve is in "STOP" position, start tractor, engage PTO allow the oil to circulate through the return line filter for about 5 minutes without operation of the armhead control lever.

Operate the armhead levers through their complete range ensuring that all movements are functioning correctly.

Place the flail head at a safe attitude and move the rotor control to "START" position. After initial fluctuation the rotor should settle to a steady speed. Increase PTO speed to approximately 360RPM and run for a further five minutes before disengaging and stopping tractor.

Check the hose runs and observe that they are free from any pinching, chaffing, straining or kinks. Re-check the oil level in the tank and top up as necessary.

SI Models only
Ensure PTO lever is in neutral position, and isolate tractor hydraulic linkage. Start tractor and select external service supply. Allow the tractor to run for several minutes before attempting to operate any of the machine control levers.

On operating move the levers through their complete range ensuring that all movements are functioning correctly.

Check the tractor rear axle oil level and top up if necessary.

Place the flail head at a safe attitude and bring tractor engine revolutions to 1000RPM. Engage PTO and allow the rotor to run for several minutes. Do not leave the tractor cab or allow anyone to approach the flail head at this time.

CAUTION! Do not allow the pump to continue working if the rotor does not turn. Overheating and serious damage to the pump can be caused in a very short time.

After running up the machine, increase PTO speed to approximately 360RPM and run for a further five minutes to allow the oil to circulate through the return line filter before disengaging the PTO and stopping tractor.

Check the hose runs and observe that they are free from any pinching, chaffing, straining or kinks. Re-check the oil level in the tank and top up as necessary.
PRE-OPERATIONAL CHECKS

Check all bolts are tight and that the torque figures are correct for the specific locations indicated below:

**IMPORTANT!**
On the first day of use with a new flailhead, nuts should be checked for tightness every hour and retightened if required. Thereafter they should be checked on a daily basis prior to use of the machine. Torque nuts to the settings stated above.
OPERATION

Read The Book First
Practice operating the machine in an open space without the rotor running until you are fully familiar with the controls and operation of the machine.

Tractor Controls
For SI models only, the tractor linkage will need to be isolated.

Material Thickness Limitations
Under normal conditions the machine is capable of cutting soft types of hedge material up to 80mm thick, and hard types of hedge material up to 40mm thick.

CAUTION!
Care must be taken when working with the flail head close in as it can come into contact with the tractor.
CABLE CONTROLS

Cable controlled machines are supplied with a control unit of the type shown below – some versions will have the rotor control lever assembled alongside the armhead control levers as shown below and others may be supplied with the rotor control lever as a ‘standalone’ unit with its own individual mounting bracket.

The armhead control levers all move in a forwards and backwards direction each controlling a specific arm function.

Where applicable, if a machine is fitted with the optional electric lift float feature, operation of the lift float will be via an additional electrical switch which will need to be installed in a convenient location in the tractor cab.

LOCATION & FUNCTION OF CONTROLS

1. Arm Lift Control
2. Arm Reach Control
3. Head Angle Control / Angle Float Selection
4. Rotor Control

NOTE: The illustrations on the following pages show the method of operating all possible functions – depending on individual specifications some features may not be present on your particular machine and therefore will not be applicable.
Refer to specific cable rotor control section for additional information on rotor operation
FLOAT OPERATION - Angle Float (where applicable) / Lift Float (optional extra)

HEAD ANGLE FLOAT - Push angle lever fully forward into the detent position.

A) Angle Float OFF
B) Angle Float ON

Lift Float (where applicable)

A) Lift Float OFF
B) Lift Float ON
On cable rotor control machines the rotor is operated by the lever shown below – from the upright ‘off’ position pushing the lever forward switches the rotor on for downhill cutting and pulling the lever backwards switches the rotor on for uphill cutting. The small pivot locking lever mounted on the side of the control assembly rotates through 180° to lock the rotor in a specific cutting direction – this is a safety feature to avoid changes of rotor direction without first stopping the rotor. To change the direction of cut the rotor lever must be placed in the upright ‘off’ position; when the rotor has stopped rotating completely the pivot locking lever can be turned to the opposing position allowing the control lever to be operated for opposite cutting direction.

On some cable operated machines the rotor control lever will be assembled as part of the main bank of controls, whereas on others and all electric models it will be supplied as a ‘standalone’ unit with its own mounting bracket.

CAUTION: Ensure the rotor has stopped turning completely before attempting to change direction - When switched off a rotor can continue to ‘freewheel’ under its own momentum for up to 40 seconds before stopping.
Machines with Electric Switchbox Controls will be supplied with one of the control units shown below, the particular version will be dependent on the specification of the machine; machines fitted with cable rotor control will use the unit shown left whilst machines with electric rotor control will use the unit shown right – the only differences between the units is that the latter has 2 addition switches fitted for operation of the electric rotor control. 

**NOTE:** On machines with 3 arm functions (Lift, Reach & Angle) levers 4 and 5 are not fitted and are replaced by blanking panels.

### Powering the Controls
Activation of power to the control unit is by operation of switch ‘A’ as shown below:

- Press the switch down for Power ON (LED light on)
- Press the switch up for Power OFF (LED light off)
HEAD FLOAT OPERATION (Angle Float optional / Lift Float optional)

ROTOR OPERATION – Electric Rotor Control Models only

NOTE: The following section relates to machines with Electric Rotor Control only – for Cable Rotor Control models refer to the cable rotor control section.

Selection of Rotor Cutting Direction

Uphill Cutting

Downhill Cutting
Switching the Rotor On
For safety reasons, to prevent accidental starting of the rotor, the ‘Rotor On’ switch cannot be activated in a single operation or without first selecting the direction of cut – the procedure for starting the rotor is as follows:
Select the required cutting direction - the Rotor On/Off Switch (D) must then be switched upwards and held in position for a minimum of 8 seconds before switching it into the fully down ‘on’ position where it will remain until it is switched off. When the switch is moved to the down position the red LED light below the switch will be lit to signify the rotor is on – if the LED does not light the switch was not held in its up position for long enough and the rotor will not have started, repeat the process again holding the switch upwards for a longer period.

Rotor Start

Switching the Rotor Off
Stopping the rotor is performed by switching either the Rotor Power Switch (D) or the Rotor Direction Switch (E) to the central (off) position – the red LED light will go out to signify the rotor has been switched off.

CAUTION: When the rotor is switched off it will continue to ‘freewheel’ under its own momentum for up to 40 seconds before finally coming to a standstill – do not leave the tractor cab or attempt to approach the flailhead until the rotor has stopped turning completely.

Rotor Stop

Alternative Rotor Stop
Machines with Electric Monolever Controls will be supplied with one of the control units shown below, the particular version will be dependent on the specification of the machine; machines fitted with cable rotor control will use the unit shown left whilst machines with electric rotor control will use the unit shown right – the only differences between the units is that the latter has 2 addition switches fitted for operation of the electric rotor control.

NOTE: On machines with 3 arm functions (Lift, Reach & Angle) joystick buttons 4 & 5 do not operate any function.

Powering the Controls
Activation of power to the control unit is by operation of switch ‘A’ as shown below:

- Rotate the switch clockwise to Power ON (LED light on)
- Press the switch to Power OFF or Emergency Stop (LED light off)

LOCATION & FUNCTION OF CONTROLS

1. Arm Lift Control
2. Arm Reach Control
3. Flailhead Angle Control
4. N/A
5. N/A

A. Power On/Off (Emergency Stop)
B. N/A
C. Head Float - Angle/Lift (Option)
D. Rotor On/Off (Electric RCV models)
E. Rotor Direction (Electric RCV models)
HEAD FLOAT OPERATION (Angle Float optional / Lift Float optional)

ROTOR OPERATION – Electric Rotor Control Models only

NOTE: The following section relates to machines with Electric Rotor Control only – for Cable Rotor Control models refer to the cable rotor control section.

Selection of Rotor Cutting Direction

Uphill Cutting

Downhill Cutting
Switching the Rotor On
For safety reasons, to prevent accidental starting of the rotor, the ‘Rotor On’ switch cannot be activated in a single operation or without first selecting the direction of cut – the procedure for starting the rotor is as follows:
Select the required cutting direction - the Rotor On/Off Switch (D) must then be switched upwards and held in position for a minimum of 8 seconds before switching it into the fully down ‘on’ position where it will remain until it is switched off. When the switch is moved to the down position the red LED light above the switch will be lit to signify the rotor is on – if the LED does not light the switch was not held in its up position for long enough and the rotor will not have started, repeat the process again holding the switch upwards for a longer period.

Rotor Start

Switching the Rotor Off
Stopping the rotor is performed by switching either the Rotor Power Switch (D) or the Rotor Direction Switch (E) to the central (off) position – the red LED light will go out to signify the rotor has been switched off.

CAUTION: When the rotor is switched off it will continue to ‘freewheel’ under its own momentum for up to 40 seconds before finally coming to a standstill – do not leave the tractor cab or attempt to approach the flailhead until the rotor has stopped turning completely.

Rotor Stop

Alternative Rotor Stop
XTC (Mk2) PROPORTIONAL SWITCHBOX CONTROLS (5 Service Models)

Machines with XTC Mk2 Proportional Controls (5 service models) will be supplied with the control unit shown below. The units for both electric and cable controlled rotor machines are identical except that for cable versions the rotor control switches B, C & D (shown below) will not provide a function as rotor operation will be controlled by a separate cable lever unit (refer to specific cable rotor control page for operation details of that unit).

Note: 2 sets of control buttons are installed on each side of the unit for operation of Angle Float & Lift Float, both sets of buttons and their LED’s are linked and therefore perform exactly the same function; they are installed to allow for operator preference.

LED Lights
An LED light adjacent to each control button reports the status of that particular function – when the function is selected the LED light will illuminate to confirm the function is active; the light will switch off on de-selection of that function.

Powering the Controls
Activation of power to the control unit is by operation of the red button switch ‘A’ as shown below:

Rotate clockwise for Power ON (LED light on)
Press for Power OFF / Emergency Stop (LED light off)

LOCATION & FUNCTION OF CONTROLS

1. Arm Lift Control
2. Arm Reach Control
3. Head Angle Control
4. Arm Slew Control (Default Mode)
5. Tele*/Midcut*/VFR* Control (Default Mode)

A. Power On/Off (LED ‘a’ indicates status)
B. Rotor Start (Uphill Cutting Direction)
C. Rotor Start (Downhill Cutting Direction)
D. Rot or Stop
E. Auto Reset
F. Head Angle Float On/Off
G. Lift Float On/Off (Option)

* Applies to the specific model only

Note: 2 sets of control buttons are installed on each side of the unit for operation of Angle Float & Lift Float, both sets of buttons and their LED’s are linked and therefore perform exactly the same function; they are installed to allow for operator preference.
ARM OPERATION
HEAD FLOAT OPERATION

**Angle Float (Standard Feature)**

**Lift Float (Optional Feature)**

**ROTOR OPERATION – Electric Rotor Control Models only**

*NOTE: The following section relates to machines with electric rotor control only – for cable rotor control models refer to the specific cable rotor control section.*

**Rotor Start (Selection of Rotor Cutting Direction)**
Select rotor start for required direction (LED will light to indicate the active direction).

**Uphill Cutting**

**Downhill Cutting**
**Switching Rotor Direction**
With the rotor running, changing the rotor cutting direction can only be achieved after first operating ‘rotor stop’, when stop has been selected the specific direction button can then be operated to command the rotor to switch to the desired direction. NOTE: This function has a built-in time delay of approximately 8 seconds - this is a machine protection feature that allows the rotor sufficient time to de-accelerate before restarting in the opposite direction. The LED light of the active cutting direction will flash on and off during the slowing down period, when the direction has changed the LED for the new direction will be illuminated.

**Switching the Rotor Off**
Stopping the rotor is performed by operation of the rotor stop button as illustrated below. When rotor off has been selected the LED light above the button of the active cutting direction will flash on and off for approximately 8 seconds to signify that the rotor has been switched off, after this 8 second period the light will go off completely. NOTE: The rotor will continue to rotate under its own power until it finally comes to a standstill.

**CAUTION:** When the rotor is switched off it will continue to ‘freewheel’ under its own momentum for up to 40 seconds before finally coming to a standstill – do not leave the tractor cab or attempt to approach the flailhead until the rotor has stopped turning completely.
Machines with XTC Mk3 Proportional Controls (7 service) will be supplied with the control unit shown below. The units for both electric and cable controlled rotor machines are identical except that for cable versions the rotor control switches B, C & D (shown below) will not provide a function as rotor operation will be controlled by a separate cable lever unit (refer to specific cable rotor control page for operation details of that unit).

Identification & Function of Controls

1. Arm Lift Control.
2. Arm Reach Control.
3. Head Angle Control.
4. Slew Control (Default) / 6th Service*
5. Tele/Midcut/VFR Control.
A. Power On/Off (LED ‘a’ indicates status).
B. Rotor Start (Uphill Cutting Direction).
C. Rotor Start (Downhill Cutting Direction).
D. Rotor Stop.
E. Auto Reset.
F. Head Angle Float On/Off.
G. Lift Float On/Off (Option).
H. 6th Service* / Slew (Swapped Mode).
I. 6th Service Activation Switch
J. 7th Service On/Off (if applicable)
K. N/A
* If applicable

*NOTE: On machines that feature a controllable 6th service the functions are operated by default using the ▼ ▲ buttons (H), this control can be swapped to operation by the left hand thumb switch (4) by activation of the D1 control panel button; in this case Slew is then operated by use of the ▼ ▲ buttons (H). Control panel button D2 is used for any other additional services that require on/off control only i.e. Debris Blower / Diverter Valve.

LED Lights

LED lights adjacent to control button reports the status of that particular function; when the function is selected the LED light will illuminate to confirm that the function is active; the light will switch off on de-selection of the function.

Powering the Controls

Activation of power to the control unit is by operation of the red button switch as shown below:

Rotate clockwise for Power ON (LED light on confirms power on)  
Press for Power OFF / Emergency Stop (LED light off confirms power off)
ARMHEAD OPERATION

Left Hand Machines

LIFT

Right Hand Machines

REACH

ANGLE

SLEW

Auto Reset

MIDCUT / VFR / TELE
(where applicable)
6th SERVICE (Where applicable)

Default Mode

Swapped Mode (D1 Activated)

On machines fitted with a controllable 6th service default operation of that function will be via the ◄ ► buttons on the control unit. If required, control of the function can be swapped to the left hand toggle switch by activating the D1 button on the control panel; in this mode slew operation will then be transferred to the ◄ ► buttons. De-activating D1 will return the functions to their default controls. An LED light above the button confirms when the service is active.

7th SERVICE (Where applicable)

Additional services that require ON/OFF control only are operated by the D2 button on the control panel; pressing the button will switch the service on, pressing the button again will switch it off. An LED light above the button confirms when the service is active.
HEAD FLOAT OPERATION

Angle Float (Optional)

Lift Float (Optional)

ROTOR OPERATION – Electric Rotor Control Models only

NOTE: The following section relates to machines with electric rotor control only – for cable rotor control models refer to the specific cable rotor control section in the manual.

Rotor Start (Selection of Rotor Cutting Direction)
Select rotor start for required direction (LED will light to indicate the active direction).

Uphill Cutting

Downhill Cutting
Switching Rotor Direction
With the rotor running, changing the rotor cutting direction can only be achieved after first operating ‘rotor stop’, when stop has been selected the specific direction button can then be operated to command the rotor to switch to the desired direction. NOTE: This function has a built-in time delay of approximately 8 seconds - this is a machine protection feature that allows the rotor sufficient time to de-accelerate before restarting in the opposite direction. The LED light of the active cutting direction will flash on and off during the slowing down period, when the direction has changed the LED for the new direction will be illuminated.

Switching the Rotor Off
Stopping the rotor is performed by operation of the rotor stop button as illustrated below. When ‘rotor off’ has been selected the LED light above the button of the active cutting direction will flash on and off at an increasing frequency for approximately 8 seconds to signify that the rotor has been switched off, after this 8 second period the light will go off completely. NOTE: The rotor will continue to rotate under its own power until it finally comes to a standstill.

CAUTION: When the rotor is switched off it will continue to ‘free wheel’ under its own momentum for up to 40 seconds before finally coming to a standstill - do not leave the tractor cab or attempt to approach the flailhead until the rotor has stopped turning completely.
CONTROL UNIT CALIBRATION

If for any reason the controls should stop responding the unit will need to be calibrated; the procedure for this is shown below.

Press and release the rotor stop button to enter calibration mode; all led's will simultaneously flash once to confirm.

Power led will flash on and off continuously whilst the unit is in calibration mode.

With the unit powered off; simultaneously press and hold both rotor direction buttons before then powering on the unit.

When all the led's light up; release both buttons.

Press and release the rotor stop button to enter calibration mode; all led's will simultaneously flash once to confirm.

Power led will flash on and off continuously whilst the unit is in calibration mode.

Operate the joystick through its complete range of movements 4 to 5 times then operate each toggle switch fully forwards and fully backwards 4 to 5 times.

Press the rotor stop button once to exit calibration mode; the rotor stop led will flash rapidly to confirm and the power led will stop flashing and remain lit.

T - AUXILIARY
U - N/A
V - CUT OFF
ROTOR OPERATION

TI Machines
Depending on the particular build, rotor operation on machines with independent hydraulic systems will either be via a cable operated rotor control lever or by operation of the rotor control switch on the machines control unit – refer to the previous controls section for specific details of operation.

SI Machines
On Semi-independent machines ROTOR ON/OFF is controlled by operation of the tractors PTO lever. The procedure for starting and stopping the rotor is as follows;

To start the rotor:
- Bring tractor engine revs up to 1000RPM
- Engage PTO

To stop the rotor:
- Disengage PTO Do not leave tractor seat until the rotor is stationary.

Reversing Rotation
- Fully extend the armhead and lower flail to the ground (this will minimise oil loss).
- Release the hoses from the rotor relief valve and interchange (*).

(*) IMPORTANT: Do not interchange the flail supply and return hoses at any other point as the hose routing and cross overs in the installation are necessary to allow the hoses to flex correctly during normal arm movements.

To ascertain the direction of cut without running the machine the following applies;

Connection P - (lower motor rigid pipe) \{ up\ward cutting direction \}
Connection MR - (Upper motor right pipe)

Connection P - (Upper motor rigid pipe) \{ down\ward cutting direction \}
Connection MR - (Lower motor rigid pipe)

Rotor Operating Speed

\[
500 \text{ RPM} = 2400 \text{ RPM}
\]

500 - 540 RPM

540+ RPM
Machines are equipped with a ‘breakaway system’ to protect components in the event of the flailhead or arm coming into contact with immovable objects or obstructions, depending on the particular model the breakaway system will either be mechanical or hydraulic; in the case of hydraulic breakaway the feature is also utilised for transportation and power park to fold the machine into a compact position.

**Mechanical Breakaway System**

The mechanical breakaway systems consist of a ‘swing’ link built into the working side of the mainframe; when sufficient force is applied to the frame, through the extended arm, the frame ‘swings’ on the link taking the arm and head in a rearwards direction protecting them from sudden impact damage.

It is important to remember that any breakback or collision protection features do not replace operator responsibility; they purely allow the operator additional time in which to react to a situation and halt forward movement and/or operate the arm to clear the obstacle.

In the event of breakback, the swing link returns the frame and arm, under their own weight, back into the working position once the obstacle has been cleared.

**CAUTION**

Never work at a speed that fails to allow for sufficient stopping time in the event of breakback; it is the operators responsibility to ensure forward travel can be halted at any time before the machine reaches its breakback limit, failure to observe this can result in serious damage to the machine.

CAUTION! There is no protection for the arms in the reverse direction.

**Top Link Buffer**

To increase protection, these models also feature a rubber buffer on the top link; this helps to absorb and reduce impact in the event of an accidental collision occurring when the machine is working with the head in a high position.
Swing Link Modes for Work & Transport

**Work Mode:** The locking pin is stowed in the rearmost hole of the main frame allowing free movement of the frame. Always use this position during work.

**Transport Mode:** The locking pin is located in the front hole of the main frame to lock the swing link to prevent movement of the frame. This mode should be used at all times other than during work.
TRANSPORT

The machine should be transported with the arms in the folded position; always ensure it is folded in as compactly as possible. When transporting on the public highway all local rules and bylaws should be respected.

When transporting the machine always ensure;

- Transport lock pin is fitted.
- PTO is disengaged.
- Lift ram tap is closed.
- Power to control box is switched off (where applicable).

Transport Speed

The acceptable speed of transport will vary greatly depending upon the ground conditions. In any conditions always avoid driving at speeds which cause exaggerated bouncing as this will put unnecessary strain on the tractor’s top hitch position.

Transport Height

There is no fixed dimension for transport height as this will vary depending on the size of the carrying vehicle and the height it is carried at. The operator should make themselves aware of the machines height at all times especially when maneuvering under or near overhead obstructions or buildings.

Moving from Transport to Work

When moving from transport position into work position the transport locking pin must be removed from the lock position and the lift ram tap opened before operating the machine. The reverse applies when moving from work to transport.

EMERGENCY STOPPING

In all emergency situations machine operation and functions must be stopped immediately; Stop PTO operation using the tractor controls then immediately kill electrical power to the machine using the Off (Emergency Stop) switch on the machine’s control unit.

WARNING: Auto-Reset Machines

When the Auto-Reset feature is active the machines arm set is capable of unintentional movement even when the PTO is switched off and stationary. Always ensure that electrical power to the machine is switched off using the Off (Emergency Stop) switch on the machine’s control unit in emergency situations and/or when the machine is not being operated.

WARNING: Cable Operated Machines

In certain conditions, and/or if the Auto-Reset feature is active, the arm sets on cable operated machines possess the potential to move unintentionally, even when the PTO is switched off and stationary, if the levers were to be accidentally operated. Care must be adopted to avoid any movement of the levers when the machine is not being operated. Ensure arm sets are lowered fully to the ground when the machine is parked up or not in use.
The procedure for removal of the machine is as follows;

**IMPORTANT:** Disconnection of top link must be the last operation prior to driving the tractor away from the machine.

**WARNING:** Never attempt to operate the machine controls through the rear cab window whilst standing on or amongst linkage components.

- Select a firm level site for parking the machine.
- Lower the parking legs in their sockets and secure in the lowered position.
- Raise the machine on the tractors linkage until the weight of the machine is taken off the stabiliser. Remove the lower stabiliser pins.
- Open the lift ram tap.
- Lower the machine to the ground.
- Extend the arms and place the flailhead on the ground at half reach.
- Switch off tractor.
- Disengage tractor PTO and remove.
- Disconnect stabiliser bars and/or loosen check chains.
- Remove control unit from tractor cab.
- On SI models only; disconnect the supply and return hoses and stow with hose ends clear of the ground. *Blank off hose ends to protect from contaminants.*
- Remove draft links.
- Disconnect stabiliser from tractors top hitch position. On Mk3 models allow stabiliser to slide along rail until it contacts the eccentric stops.
- Carefully drive the tractor away from the machine.
- Check the machine is stable, if necessary secure with blocks and/or suitable props.

**Storage**

If the machine is to be left standing for an extended period of time, lightly coat the exposed areas of the ram rods with grease. Subsequently, this grease should be wiped off before the rams are next moved.

It is recommended, wherever possible, that the machine is stored under cover of a building in a clean dry environment to protect it from the elements. Machine controls should be stowed in a safe location clear of the ground. Cover controls with a piece of tarpaulin or canvas, do not use plastic bags as these harbour condensation and can lead to rapid corrosion of components.
GENERAL WORKING PRACTICES

Tractor Forward Speed

The material being cut determines tractor forward speed. Forward speed can be as fast as that which allows the flail head sufficient time to cut the vegetation properly.

Too fast a speed will be indicated by over frequent operation of the breakaway system, a fall off in tractor engine revs and a poor finish to the work leaving ragged uncut tufts and poorly mulched cuttings.

Hedgecutting Procedure

1. 
2. 
3. 
4. 
5.

WARNING! Never cut on the blind side of the hedge;
It is impossible to see potential hazards or dangers and the position of the flail head would allow debris to be propelled through the hedge towards the tractor and the operator.
Flailhead Wire Trap
The flail head is equipped with a wire cutting edge welded into the underside. This is to ensure that the ends of any wire that may be entwined in the rotor are cut and fall within the confines of the flail head. **This plate should not be interfered with in any way.** Any wire caught in the rotor must be removed immediately (*see below*).

Removing Wire
- Select rotor **OFF** and wait until it has **stopped rotating**.
- **STOP** tractor and remove the starting key - **only then** remove wire.
- **Do not reverse the rotor** in an attempt to unwind any wire.
OVERHEAD POWER LINES (OHPLs)

It cannot be stressed enough the dangers involved when working in the vicinity of Overhead Power Lines (OHPLs). Some of our machines are capable of reach in excess of 8 metres (26’); they have the potential to well exceed, by possibly 3 metres (9’ 9”), the lowest legal minimum height of 5.2 metres from the ground for 11,000 and 33,000 volt power lines.

Remember electrocution can occur without actually coming into contact with a power line as electricity can ‘flashover’ when machinery gets close to it.

**WARNING:** All operators must read the following information and be aware of the risks and dangers involved when working in the vicinity of Overhead Power Lines (OHPLs).

Wherever possible the safest option is always to avoid working in areas close to OHPLs. Where unavoidable, all operators must perform a risk assessment and implement a safe procedure and system of work – see following page for details.

All operators should perform a risk assessment before operating the machine within 10m horizontal distance of any OHPLs.

**Minimum Heights for Overhead Power Lines**

![Minimum Heights Diagram]

**Absolute Minimum Exclusion Zones for Specific Overhead Power Lines**

![Exclusion Zones Diagram]
Definitions of Exclusion Zones

Risk Assessment
Before starting to work near OHPLs you should always assess the risks. The following points should be observed:

- **Know** the risks of contacting OHPLs and the risk of flashover.
- **Find out** the maximum height and maximum vertical reach of your machine.
- **Find out** the location and route of all Power Lines within the work area.
- **Find out** the operating voltage of all Power Lines within the work area.
- **Contact** the local Distribution Network Operator (DNO) who will be able to advise you on the operating voltage, safe minimum clearance distance for working, and additional precautions required.
- **Never** attempt to operate the machine in exclusion zones.
- **Always** work with extreme caution and plan your work ahead to avoid high risk areas.
- **If doubt exists** do not work in the area – never risk the safety of yourself or others.

Emergency Action for Accidents Involving Electricity

- Never touch an overhead line - even if it has been brought down by machinery, or has fallen. Never assume lines are dead.
- When a machine is in contact with an overhead line, electrocution is possible if anyone touches both the machine and the ground. Stay in the machine and lower any raised parts in contact or drive the machine out of the lines if you can.
- If you need to get out to summon help or because of fire, jump out as far as you can without touching any wires or the machine - keep upright and away.
- Get the electricity company to disconnect the supply. Even if the line appears dead, do not touch it - automatic switching may reconnect the power.

Further information and leaflets on this and other agricultural safety subjects are available on the 'Health & Safety Executive' website at the following address: [www.hse.gov.uk/pubns/agindex.htm](http://www.hse.gov.uk/pubns/agindex.htm)
LIFT FLOAT KIT (Optional extra for ground cutting)

Lift Float Kits are available as an optional extra for use in ground cutting duties. The kits enable the flailhead to automatically follow the contours of the ground in the vertical plane - this is ideal for verge mowing as it greatly reduces the need for operator input.

Kits can be supplied in either manual or electric versions, part numbers for which are 8126326 & 8126327 respectively.

Kits are mounted on the rear of the mainframe using the pre-drilled holes provided.
MAINTENANCE

General Lubrication
The example illustration below indicates the general locations of lubrication points - all points should be greased on a daily basis and prior storage of the machine. New machines must be greased prior to first use.

PTO Shaft
The PTO shaft and its guards should be regularly examined. The universal joints should be greased sparingly i.e. one shot weekly.

NOTE: Overgreasing of universal joints will blow out the cork or neoprene sealing rings that protect the needle bearings from dirt and contamination.

The two halves of the plastic guard should be checked daily prior to work to ensure they spin freely on the shaft. The nylon slip rings which support the guard on the driveshaft should be greased at weekly intervals.

The telescopic driveshaft should be separated and grease applied to the internal shaft at approximate 100 hour intervals.
SERVICE SCHEDULE

Every Day
- Grease machine fully prior to work (and prior to storage).
  *NOTE: New machines must be greased before initial use.*
- Check for broken or damaged flails.
- Check tightness of flail nuts and bolts.
- Visually check for oil leaks and damaged hoses.
- Check all guards and safety shields are correctly fitted and undamaged.
- Ensure all lights are working and clean.
- Check oil level.
- Clean the cooler matrix, in dusty conditions more frequent cleaning is required.

After initial 50 Hours
- Change gearbox oil.

After initial 100 Hours or 12 Months (whichever occurs first)
- Change return line filter element. *Failure to do so will invalidate the warranty.*
  *Note; factory fitted filter elements are identified differently to replacement elements.*

Every 25 Hours
- Grease PTO Shaft universal joints and tubes.

Every Week
- Check tightness of all nuts and bolts.
- Check gearbox oil level.
- Check for wear on telescopic arm pads – *where applicable.*

Every 100 Hours
- Grease PTO shaft shield lubrication points.

Every 500 Hours
- Change return line filter element.
- Change gearbox oil.
- Check condition of hydraulic oil and change if required; *when changing the oil, new return line filter and suction strainer elements should be fitted and the return line filter changed again after 100 hours of work.*

Annually
- Change tank breather.
**HYDRAULIC SYSTEM**

**Oil Supply**
Check the oil level in the reservoir daily.

**Oil Condition & Replacement**
No fixed time period can be quoted for oil changes as operating conditions can vary widely but a visually inspection of the oil will often indicate its current overall state. Signs of a reduction in its condition will be apparent by changes in colour and appearance when compared to new oil. Oil in poor condition can be dark, smell rancid or burnt, or in some cases be yellow, unclear or milky in appearance indicating the presence of air or emulsified water. Moisture resulting from condensation can become entrapped in the oil causing emulsification that can block the return line filter, consequentially the filter system will be by-passed and the oil and any possible contaminants present will continue to circulate without filtration risking damage to hydraulic components. All are indications or conditions that will require replacement of the oil.

Hydraulic oil is a vital component of the machine; contaminated oil is the root cause of 70% of all hydraulic system failures. Contamination can be reduced by the following;

- Cleaning around the reservoir cap before removal, and keeping the tank area clean.
- Use of clean containers when replenishing the system.
- Regular servicing of the filtration system.

**Filtration System**
Machines are protected by both replaceable 125 micron suction strainers and low pressure 25 micron full flow return line filters – the diagram below is a ‘scaled up’ view illustrating the filtering capability built into the hydraulic system of the machine:

![Filtering Capability Diagram](image)

**Suction strainers**
The replaceable 125 micron suction strainers (*Part No. 8401097*) are fitted within the hydraulic tank and are ‘screw’ fitted with easy access for removal and replacement.

**Return Line Filter**
The 25 micron absolute filter elements (*Part No. 8401089*) should be changed after the first 100 hours or 12 months (whichever occurs first), and thereafter at 500-hour intervals. It is important to note hours worked as if the filter becomes blocked an internal by-pass within the canister will operate and no symptoms of filter malfunction will occur to jog your memory.

**Tank Breather**
To reduce the risk of pump cavitation it is advisable to replace the 25 micron absolute tank breather (*Part No. 8401050*) on an annual basis under normal working conditions – for machines operating in dry dusty environments it is recommended that replacement be increased to 6 monthly.
PTO Gearbox
Check gearbox oil level on new machines prior to first use, top up if required before using the machine. **Replace gearbox oil after an initial 50 hours of use** and thereafter at annual or 500 hour intervals; whichever occurs earliest.

**Gearbox Capacity (Machines ► 11/13)**
0.7 Litre SAE75W90 Fully Synthetic which meets the following minimum requirements;
- Viscosity at 40°C, cSt, 100.0 min.
- Viscosity at 100°C, cSt, 17.2 min.

Drainage of the gearbox for an oil change is via the drain plug located on the base of the gearbox. To refill or for ‘topping up’ remove filler and level plugs indicated opposite and fill gearbox via the filler plug to a point where the oil starts to run from the level plug orifice. Replace both plugs and tighten.

**Gearbox Capacity (Machines 11/13 ▶ )**
0.6 Litre SAE75W90 Fully Synthetic which meets the following minimum requirements;
- Viscosity at 40°C, cSt, 100.0 min.
- Viscosity at 100°C, cSt, 17.2 min.
Hydraulic Hoses
The condition of all hoses should be carefully checked during routine service of the machine. Hoses that have been chaffed or damaged on their outer casing should be securely wrapped with waterproof adhesive tape to stop the metal braid from rusting. Hoses that have suffered damage to the metal braid should be changed at the earliest opportunity.

Hose Replacement
- Replace one hose at a time to avoid the risk of wrong connections.
- When the hose is screwed to an additional fitting or union, use a second spanner on the union to avoid breaking both seals.
- Do not use jointing compound on the threads.
- Avoid twisting the hose. Adjust the hose line to ensure freedom from rubbing or trapping before tightening hose end connections.

Before changing hoses study the installation; these are carefully calculated to prevent hose damage during operation - always replace hoses in exactly the same manner, this is especially important for the flail hoses as they must be crossed, upper to lower, at both the dipper pivot point and the head pivot point.

All Hydraulic Hoses (BSP) now fitted to McConnel Power Arm Hedge/Grass Cutters have ‘soft seal’ connections on both flail and ram circuit hoses.

The recommended torque settings for nut security are as follows;

<table>
<thead>
<tr>
<th>O Ring ref.</th>
<th>1/4” BSP</th>
<th>=</th>
<th>24 Nm</th>
<th>or</th>
<th>18 Lb-Ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 000 01</td>
<td>3/8” BSP</td>
<td>=</td>
<td>33 Nm</td>
<td>or</td>
<td>24 Lb-Ft</td>
</tr>
<tr>
<td>10 000 02</td>
<td>1/2” BSP</td>
<td>=</td>
<td>44 Nm</td>
<td>or</td>
<td>35 Lb-Ft</td>
</tr>
<tr>
<td>10 000 03</td>
<td>5/8” BSP</td>
<td>=</td>
<td>58 Nm</td>
<td>or</td>
<td>43 Lb-Ft</td>
</tr>
<tr>
<td>10 000 04</td>
<td>3/4” BSP</td>
<td>=</td>
<td>84 Nm</td>
<td>or</td>
<td>62 Lb-Ft</td>
</tr>
<tr>
<td>10 000 05</td>
<td>1” BSP</td>
<td>=</td>
<td>115 Nm</td>
<td>or</td>
<td>85 Lb-Ft</td>
</tr>
<tr>
<td>10 000 06</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For hose unions (BSP) fitted in conjunction with bonded seals the recommended torque settings are as follows:-

<table>
<thead>
<tr>
<th>O Ring ref.</th>
<th>1/4” BSP</th>
<th>=</th>
<th>34 Nm</th>
<th>or</th>
<th>25 Lb-Ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 000 01</td>
<td>3/8” BSP</td>
<td>=</td>
<td>75 Nm</td>
<td>or</td>
<td>55 Lb-Ft</td>
</tr>
<tr>
<td>10 000 02</td>
<td>1/2” BSP</td>
<td>=</td>
<td>102 Nm</td>
<td>or</td>
<td>75 Lb-Ft</td>
</tr>
<tr>
<td>10 000 03</td>
<td>5/8” BSP</td>
<td>=</td>
<td>122 Nm</td>
<td>or</td>
<td>90 Lb-Ft</td>
</tr>
<tr>
<td>10 000 04</td>
<td>3/4” BSP</td>
<td>=</td>
<td>183 Nm</td>
<td>or</td>
<td>135 Lb-Ft</td>
</tr>
<tr>
<td>10 000 05</td>
<td>1” BSP</td>
<td>=</td>
<td>203 Nm</td>
<td>or</td>
<td>150 Lb-Ft</td>
</tr>
<tr>
<td>10 000 06</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SAFETY NOTE: Soft seal hose connections are capable of holding pressure even when the nut is only finger tight; it is therefore recommended that when dismantling, the hose be manually flexed with the retaining nut slackened off - this will relieve any residual pressure prior to complete disassembly.
Cables
The cables operate on a push/pull system with the spool centring springs always returning the spool to the neutral position when the handle is released. Care should be taken during installation and operation to ensure that the cables are not trapped or kinked. Any abrasion or damage to the outer casing should be sealed with plastic insulation tape to avoid moisture penetrating. No routine adjustments of the cables are necessary as they do not stretch. The threaded collar is correctly adjusted when the lever is in a vertical position in its housing allowing an equal amount of travel in either direction.

CAUTION: On no account should any attempt be made to lubricate the cables which are assembled with a special lubricant during manufacture.

Note: Take care to ascertain the correct cable connections on both the control unit and the valve in the event of cable replacement.
PTO SHAFT LUBRICATION

The PTO shaft should be lubricated on a regular basis using lithium based grease – each end of the shaft has 2 greasing points; one for lubrication of the universal joint and one for lubricating the rotating fixing ring of the shaft shield – access to the lubrication points is gained by releasing the shaft shield from its fixing ring and sliding it back along the body of the driveshaft – *the procedure and lubrication frequency is illustrated below.*

Slide the shaft shield back into place after lubrication ensuring the clasps relocate correctly in the fixing ring – always fit torque chains to the shields to stop them from rotating with the shaft during operation.
TORQUE SETTINGS FOR FASTENERS

The chart below lists the correct tightening torque for fasteners. This chart should be referred to when tightening or replacing bolts in order to determine the grade of bolt and the correct torque unless specific torque values are assigned in the text of the manual.

Recommended torque is quoted in Foot-Pounds and Newton-Metres within this manual. The equation for conversion is 1 Nm. = 0.7376 ft.lbs.
